

How can I connect my other entertainment equipment when I install a digital set top box?

Your set top box is likely to be one of a number of audio/video (AV) devices, such as VCRs, DVDs, sound systems and video cameras that can be connected to your TV.

This diagram shows how to connect your AV equipment when installing your set top box. If your TV does not have enough AV inputs to connect all your equipment, ask your retailer about an AV switcher to enable you to connect more than one device to a single AV input. You can also switch through a home theatre amplifier.

However, it should be noted that connecting multiple pieces of equipment can be complicated. You might like to ask your retailer if they can install the equipment for you, or if they can recommend someone who can.
